Question 1 Correct

Marked out of 1.00 question

convert it to binary and determine the value of the the 4<sup>th</sup> least significant digit.

Status Finished

**Duration** 3 mins 52 secs

**Example** number = 23 $= (10111)_2.$ 

Returns:

**Constraints** 

 $0 \le \text{number} < 2^{31}$ 

Sample Case 0

Sample Input 0

STDIN Function

**Sample Output 0** 

0

**Function Description** Complete the function fourthBit in the editor below.

Started Monday, 13 January 2025, 8:54 AM

Completed Monday, 13 January 2025, 8:58 AM

A binary number is a combination of 1s and 0s. Its n<sup>th</sup> least significant digit is

the n<sup>th</sup> digit starting from the right starting with 1. Given a decimal number,

Convert the decimal number 23 to binary number:  $23^{10} = 2^4 + 2^2 + 2^1 + 2^2 + 2^3 + 2^4 +$ The value of the 4<sup>th</sup> index from the right in the binary representation is 0.

fourthBit has the following parameter(s): int number: a decimal integer int: an integer 0 or 1 matching the 4th least significant digit in the binary representation of number.

**Input Format for Custom Testing** Input from stdin will be processed as follows and passed to the function. The only line contains an integer, number.  $32 \rightarrow number = 32$ 

**Explanation 0** Convert the decimal number 32 to binary number:  $32_{10} = (100000)_2$ . The value of the 4th index from the right in the binary representation is 0. **Sample Case 1 Sample Input 1** STDIN Function  $77 \rightarrow \text{number} = 77$ **Sample Output 1 Explanation 1** Convert the decimal number 77 to binary number:  $77_{10} = (1001101)_2$ . The value of the 4th index from the right in the binary representation is 1.

Answer: (penalty regime: 0 %) Reset answer 1 | /\* \* Complete the 'fourthBit' function below. 2 3  $\ast$  The function is expected to return an INTEGER. \* The function accepts INTEGER number as parameter. 6 \*/ 7 int fourthBit(int number) 9 🔻 { int binary[32]; 10 int i=0; 11 while(number>0) 12 13 • binary[i]=number%2; 14 number/=2; 15 16 1++; 17 if(i>=4)18 19 20 return binary[3]; 21 else 22 return 0; 23 24 25 } **Expected Got Test** printf("%d", fourthBit(32)) 0 **✓** printf("%d", fourthBit(77)) 1 **/** Passed all tests! <

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the pth element of the list, sorted ascending. If there is no pth element, return 0. **Example** n = 20p = 3The factors of 20 in ascending order are {1, 2, 4, 5, 10, 20}. Using 1-based indexing, if p = 3, then 4 is returned. If p > 6, 0 would be returned. **Function Description** Complete the function pthFactor in the editor below.

int: the long integer value of the p<sup>th</sup> integer factor of n or, if there is no factor at

Question **2**

▼ Flag

question

**Constraints**  $1 \le n \le 10^{15}$  $1 \le p \le 10^9$ Input Format for Custom Testing Input from stdin will be processed as follows and passed to the function. The first line contains an integer n, the number to factor.

Returns:

pthFactor has the following parameter(s):

int p: the index of the factor to be returned

that index, then 0 is returned

int n: the integer whose factors are to be found

The second line contains an integer p, the 1-based index of the factor to return. **Sample Case 0** Sample Input 0 STDIN Function  $10 \rightarrow n = 10$  $3 \rightarrow p = 3$ **Sample Output 0 Explanation 0** 

5

Factoring n = 10 results in  $\{1, 2, 5, 10\}$ . Return the  $p = 3^{rd}$  factor, 5, as the answer. Sample Case 1 **Sample Input 1** STDIN Function  $10 \rightarrow n = 10$  $5 \rightarrow p = 5$ 

**Sample Output 1** 

**Explanation 1** 

therefore 0 is returned as the answer.

Passed all tests! <

printf("%ld", pthFactor(10, 3))

printf("%ld", pthFactor(1, 1))

printf("%ld", pthFactor(10, 5)) 0

**Sample Case 2 Sample Input 2** STDIN Function  $1 \rightarrow n = 1$  $1 \rightarrow p = 1$ **Sample Output 2 Explanation 2** Factoring n = 1 results in  $\{1\}$ . The p = 1st factor of 1 is returned as the answer. **Answer:** (penalty regime: 0 %) Reset answer \* Complete the 'pthFactor' function below. \* The function is expected to return a LONG\_INTEGER. \* The function accepts following parameters: \* 1. LONG\_INTEGER n \* 2. LONG\_INTEGER p \*/ long pthFactor(long n, long p) 11 ▼ { int count=0; for(long i=1;i<=n;++i)</pre> **if**(n%i==0) count++; if(count==p) return i; return 0;

**Expected Got** 

**✓** 

Finish review

Factoring n = 10 results in  $\{1, 2, 5, 10\}$ . There are only 4 factors and p = 5,
